Abstract

This article presents the Romanian norms for The Attributional Style Questionnaire (A.S.Q.) (Peterson, Semmel, von Baeyer, Abramson, Metalsky and Seligman in 1982). The results obtained are, in general consistent with those obtained by earlier normative studies involving American samples. The sample of this study is formed from non-clinical subjects (N=234). The reliability of the new instrument is adequate, the internal consistency coefficients (Alfa Cronbach) for the four attributional processes and the global score ranged from .42 to .74.

Keywords: *attribution, ASQ, reliability*
