Abstract

This article presents the norms and internal consistency (Alfa Cronbach) for each scale of the Time Experience Questionnaire (T.E.Q.) (Ricks, Epley și Wessman, 1973) calculated for the Romanian population. A sample of 226 subjects of both sexes were used with ages between 17 and 66. The obtained results for the internal consistency for seven of the eight scales were satisfactory, ranging from .59 to .82. For one of the scales however, the internal consistency value was less than the admitted value (.35). In general the T.E.Q. is an efficient tool for measuring the way in which people organize their time and also outline some important aspects of their personality involved in this activity.

Keywords: *time experience, consistency, TEQ*
